

FOSTAC MAXIMUS®

What do we believe happens to electrons in the FOSTAC MAXIMUS®?

In connection with research into and creation of new electronic medical systems to be taken into space by Russian astronauts, East European quantum physicists inform us that the information for all matter is stored in the electrons of the atom.

According to the studies carried out by these quantum physicists, which are still controversial according to the current state of scientific knowledge, the electron represents the active part of every atom, and this means that if the information in the electron is altered, the whole atom undergoes a corresponding change of information. The studies also show that the electron develops its own spin according to the type of information (spinning in a clockwise or anti-clockwise sense). It is possible today, using complex electronics and mathematical calculations, to measure (and calculate) both the direction of the spin, the speed of spin and the wavelengths that are emitted. In the normal case, the electrons contain both biologically negative information (which causes a spin in the clockwise direction) and positive information (which causes a spin in the anti-clockwise direction).

According to the conclusions of the quantum physicists, the electrons in an electrical circuit obey the same fundamental laws. These electrons contain a surplus of negative information, resulting in a clockwise spin, which is biologically negative, and Mother Nature (people, animals and plants) may react nega-

tively to this with varying degrees of sensitivity. We refer to this as «electro-smog».

According to a further statement by the quantum physicists, the spin speed of the electron is not a fixed value; it is dependent on the information that is imprinted on it. In a mixture of negative and positive information the electron moves more slowly (negative and positive partially cancel each other out depending on the energy charge). The more polarised the information is, the more powerful will be the electron's spin.

We believe that we are able to make use of these scientifically determined properties of the electron in the FOSTAC MAXIMUS®. We believe that, by means of high-frequency information transfer, all the negative information can be erased and positive information can be imprinted. Moreover, we believe that this allows the electrons to receive a clear and distinct charge and accelerate up to a maximum value of spin (in the anti-clockwise sense), which can lead to the cancellation of electro-smog.

We are convinced that speeding up the spin of electrons in an electric circuit can achieve a significantly higher power efficiency. We believe that more power can be given off by each electron without altering the voltage or the current, so that a lower electron flow is required in order to produce the same power. Thus, less current is drawn from the power plant in order to perform the same amount of work.

It should be noted that each unit needs to be run for a certain amount of time in order to establish its energy field, and this time period may vary with the environmental conditions. Since electrons are memory stores for information, according to the quantum physics study, they are of course also influenced by their environment. In other words, a positive environment will quickly enhance the operating mode of the electrons so as to increase their efficiency. On the other hand, a constant stream of incoming negative infor-

mation can even block and prevent the increase in current efficiency while it persists.

A detailed quantum physics study is available on our homepage to anyone who is interested (currently only available in German). The first part of this contains a scientific explanation of the quantum physicist's understanding of why the device operates, part 2 explains what the quantum physicist believes is happening in the electromagnetic field of the accumulators, and in part 3 the results are analysed.

What do we believe happens in the area around a FOSTAC MAXIMUS®?

After more than 20 years of experience we are convinced that electro-smog drains the energy out of its surroundings. We believe that apartments, houses, offices and manufacturing premises are affected, and that people, animals and plants can all become drained of energy in such environments. The greater the electro-smog pollution, the greater is the degree of energy draining, in our opinion.

It is our belief that when people are affected by electro-smog they become less efficient, less motivated, less contented and less focused, and that they may also tire more rapidly due to the effects of electro-smog. We are convinced that electro-smog can be cancelled after installing the FOSTAC MAXIMUS® by transfer of information. In our opinion, the energy fields that supply all life-forms with the energy that they need are realigned, and the natural energy store is replenished. This can take some time, and the time may vary from one

place to another, depending on the previous effective charge in each case. When the energy stores are replenished, it is our opinion that this can also have a powerful effect upon the efficiency of the electricity that is required.

Some of our customers report a strong increase in well-being, more energy and zest for life when using the FOSTAC MAXIMUS®. Disturbed sleep is a thing of the past and they feel more wide-awake. Companies tell us in particular about new motivation and greater working efficiency among their staff, as well as a reduction in their electricity bills.

We believe that it is important to take the significance of energy conditions seriously. Energy is, after all, the source and the driving force of all life!
